U. S. Patent Application Serial No. 10/324,631 Inventors: Angelo A. Bione

AMENDMENTS TO THE CLAIMS

 (Currently Amended) A terminal, comprising: remote-switching means for transferring telephony services,

wherein the remote-switching means allows the transference of telephony signals from a first wiring system of a first telephony provider to a second wiring system of a second telephony provider, wherein the second telephony provider is a cable communications system.

- 2. (Original) The terminal of claim 1, wherein the remote-switching means allows the transference of wiring to provide local number portability (LNP).
- (Currently Amended) The terminal of claim 1, <u>further comprising</u>: <u>control software for receiving a command signal from the second telephony provider and for providing a command message</u>; and

a management information base for receiving the command message and for controlling the remote-switching means wherein the remote-switching means is responsive to a command-signal transmitted by the second telephony-provider.

- 4. (Currently Amended) The terminal of claim 1, the remote-switching means emprising: control software for receiving a command signal from the second telephony provider and for providing a command message; and comprising at least one switch connected between the first and the second wiring systems, the at least one switch responsive to the command message.
- 5. (Currently Amended) The terminal of claim 1, <u>further comprising a tuner for tuning to a predetermined frequency, wherein command signals and other information provided by the second telephony provider are subsequently received in the predetermined frequency, wherein the terminal <u>has an associated ineledes an</u> identifiable address, and wherein the second telephony provider transmits a command signal <u>in the predetermined frequency to the terminal</u> using the identifiable address.</u>
- 6. (Currently Amended) The terminal of claim 1, further <u>comprising</u> eomprising. a central processing unit <u>including a management information base</u>, wherein the second telephony provider requests and receives via the central processing unit a current status of the management information base, wherein the current status indicates one of receiving telephony services from the first or the second telephony provider. (CPU), eomprising:

a management information base for storing a terminal address; and

- 7. (Original) The terminal of claim 1, further comprising at least one subscriber line interface controller for receiving and providing the telephony signals to a telephony device.
- 8. (Canceled)
